

PYRO CERAM CERAMIC GLASS

We use PyroCeram which is heat-resistant glass-ceramic that can tolerate exceptionally high temperatures up to 1,256 degrees Fahrenheit. In actuality, it is a clear version of ceramic. It is also effective in blocking UV light waves.

Manufacturers use a special rating system for evaluating the strength of ceramic glass when shocked by a change in temperature.

This rating system is called Thermal Shock Resistance. PyroCeram has a high thermal shock resistance. When cold water is poured on hot PyroCeram, it does not crack or shatter the way standard annealed glass would. Having a high thermal shock resistance rating makes PyroCeram an excellent choice for replacement glass in equipment that is exposed to high temperatures. Therefore, making it an exceptional choice for woodstoves and fireplaces.

Often times once your woodstove/fireplace glass breaks you attempt to get replacement glass from the original manufacturer, only to find out they no longer make it for the model you have, or that the wait time until you receive your glass is weeks. If you are in need of replacement glass for your woodstove/fireplace, *City Window & Glass* can replace it within 24 hours. Just give us a template of the glass needed and we will custom cut it. You'll be back to enjoying your wood stove within 24 hours.

Curious if this might be the best type of glass for your project? [**Contact us**](#) and we would be happy to help.
